November, 2001

Phase Identifier

The **Phase Identifier** allows repairmen and technicians to safely and remotely perform proper phasing on primary underground distribution cables up to 15kV. Where primary distribution cables must be spliced to expand existing service or to repair damage, a technician must determine the correct phasing of the cables before they are physically joined. Instead of using a conventional phasing set inside the manhole, the technician can use the Phase Identifier to perform these routine functions safely outside of the manhole.
