Switch Blocking Pin

The **Switch Blocking Pin** is a non-conductive pin that is placed into the switch blocking location of an air break / load break switch when the switch is opened for work on the line or equipment. The blocking pin assures that the switch stays open until the pin is removed. It completely blocks the switch from operating due to vibration, wind, human error or any other undesirable actions that would cause the switch to close. The pin can be installed with a standard or shotgun hotstick.
