HD Electric Company's **V-Watch™ Personal Voltage Detector** is a device worn by workers who may be in danger of contacting an energized electrical source. The unit operates by sensing the electric field surrounding high voltage electrical equipment by sounding an audible alarm with flashing lights, which increase in frequency as the user approaches the source. Two models are available - the **V-Watch** features audible and visual alarms, a low battery indicator, built-in self-test, belt clip and soft carrying case. The **V-Watch Pro** has all the same features, and also includes a mute button to silence the audible alarm for several minutes.
